

PRODUCT CATALOGUE

COMPANY PROFILE

Kenzai Ceramics Industry Company Limited is a manufacturer and exporter of unglazed and homogeneous ceramic tiles which have been fired at 1,300 degree Celsius. Kenzai ceramic tiles have been created for natural-look in both the surface and its colors.

Kenzai Ceramics Industry Company Limited has been established since 1983 as Primarn Ceramics Co., Ltd.

In 1991, Primarn Ceramics Co., Ltd. was renamed to Kenzai Ceramics Industry Co., Ltd. With the registered capital of 10 million THB.

In 2003, Kenzai has increased the registered capital to 60 million THB.

In 2004, Kenzai Art & Design Co., Ltd. was established with the registered capital of 50 million THB. This new venture allowed Kenzai to bring in high technology machinery and know-how from Italy and Germany.

In 2005, as Kenzai Ceramics Industry Co., Ltd. increased its registered capital to 80 million THB, Kenzai Art & Design Co., Ltd. also increased its registered to 120 million THB.

In 2006, Kenzai was able to manufacture a total 4,000 square meters of ceramic tiles per day.

In 1999, Kenzai expanded and began exporting to U.S.A., Japan, Philippines, India, Saudi Arabia, U.A.E., Qatar, and Singapore.

Kenzai Ceramics Industry Co., Ltd. intends to develop high quality, natural look and durable products to serve needs of the consumers which include commercial, residential and government projects.

Kenzai ceramic tiles have passed ASTM Standard Test from U.S.A. and EN87 Standard Test from Italy.

KENZAI

PORCELAIN & CERAMIC TILES

a little

Big difference

Granite Tile : GF-206 / Color : White Granite

Granite Tile Is one of Kenzai tile first series and become the root of most Kenzai product line. The firing at high temperature (1250 °C) process makes strong body and durable tile. Granite tile has an extensive range of shapes and colors that help you to create a tile pattern that is a true reflection of you and your lifestyle. Granite tile is the most well-known and classic product line for Kenzai for more than 30 years.

Granito Porcelain Tile

Granito tile has been developed from years of experience in producing exterior tiles. It passes standard tests from America (ASTM) and European Union (EN87). Its quality is internationally accepted for having low water absorption, heavy duty usage, and being strong and durable which makes it suitable for exterior decoration. It is appropriate to be used in car parks and driveways in residential and hotel projects that require extreme luxury. Decorating along walls, whether in a classical or modern style creates unique exquisiteness and therefore accepted from architects worldwide.

Backwoods : BW-134 / Color : Palm

Backwoods

Wood is one of the essential materials that have been with humanity. Its strength and the warm atmosphere of wood, bring it to one of the most popular construction material since the ancient time. The strength of wood does not last long due to its softness, low deep abrasion, difficult to maintenance, and changes the color makes its beauty does not last long Backwoods is homogeneous wooden ceramics tiles, not only screen the pattern on its surface and also acidic resistance. Backwoods has been fired in a high temperature 1,250 degree Celsius. Thus makes Backwoods strong, durable and suitable in all area of your home. Even in a heavy duty area such as garage and drive way, high traffic area such as foot path and building entrance, High humidity are such as border of swimming pool deck. K-Bond Sanded Grout

K-BOND

Sanded Grout

Grout mix with K-Bond Sand

Polymer mixing for stronger bonding, no shrinking, no broken including mold and fungus. Suitable for grouting 3-13 mm. usage: interior and exterior floor and wall, fountain, waterfall and Swimming Pool

Characteristics

- Convenient for usage, mix with water at portion
- Mix with polymer for stronger bonding and protecting fungus

Suggestions

- Grouting tile or sanitary at 3-13 mm.
- For interior and exterior floor and wall of building
- Suitable for residence, rest room, counter and general public
- Water area such as water, fountain, water fall and well

Tile of tile for K-Bond Sanded Grout usage

- Coated Tile, Semi-Coated Tile and Non-Coated Tile
- Mosaic Natural Stone and Concrete Tile
- Brick and Cement Block
- Terazzo Tile
- Natural Stone

Ingredients

K-Bond Grout is mixed with sand compose of cement, porcelain, fine sand and chemical for fungus protection and for stronger bonding

Benefits

- The grout is beautiful, strong, durable, not mold.
- The grout groove does not shrink, does not crack,

sesame, not sifted into dust.

Limitation

- Should not use in 10°C and over 38°C
- Should be careful for scratch on tile surface and installation test on small area

Containing

- 20 KG. White / Gray

Portion

1 liter of water with 6 KG. of K-Bond Sanded Grout

Technical Data

1. 28 Day Compressive strength	15-21 N/mm ²
2. 28 Day Flexural strength	4.5 N/mm ²
3. Water retention	95 - 98%
4. Initial setting time Final setting time	3 - 4 Hrs. 6 - 8 Hrs
5. Linear Shrinkage 40x40x160 mm.	≤ 3 mm/m
6. water absorption at 30 min. water absorption at 240 min.	≤ 5 g ≤ 10 g

K-BOND

Tips

- Kbond tile adhesive can be used for low and high water absorption installation, so it is unnecessary to soak in the water
- Every 5 m. installation, need to do expansion joint and grouting with sealant polyurethane for tile expansion preventing disintegration from concrete heat
- After installation should leave 24-48 hours for water volatile then grouting and joint will be smooth
- Should use Kbond tile adhesive to together with Kbond grout for exterior area and swimming pool to reduce stain and black mold

Methods for Kbond tile adhesive and grouting (Floor)

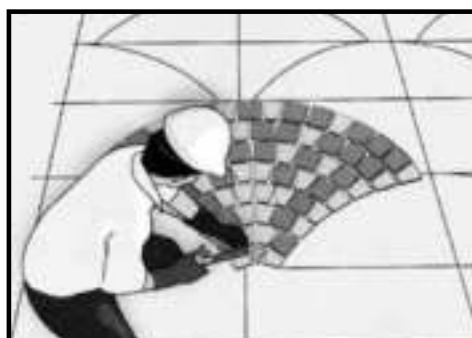

1. Tile adhesive with water portion adhesive:water 4:1

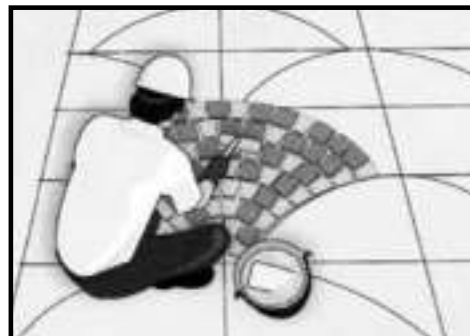

2. Pour the installing area for high level bonding

3. Apply adhesive at the back of tile

4. Install and adjust tile

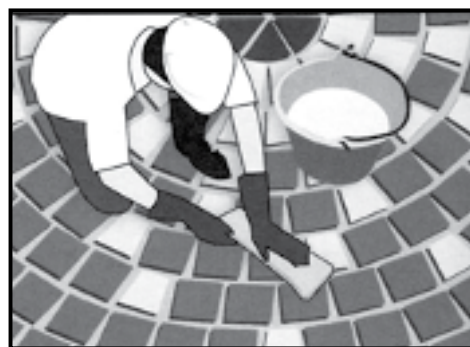

5. Brush and plate water adhesive on tile surface to clean adhesive

6. Use sponge with water to clean adhesive and leave at least 1 day then grouting

7. Pour water on the tile and use wooden trowel with Kbond Sanded Grout for grouting

8. Use sponge with water to clean tile surface and leave 1 day

Methods of Kbond Tile adhesive and Grout usage (Wall)

1. Tile adhesive with water portion adhesive:water 4:1

2. Apply adhesive at the back of tile

3. Continue installing and catch the line for certain level

4. Brush and plate water adhesive on tile surface to clean adhesive

5. Use sponge with water to clean adhesive and leave at least 1 day

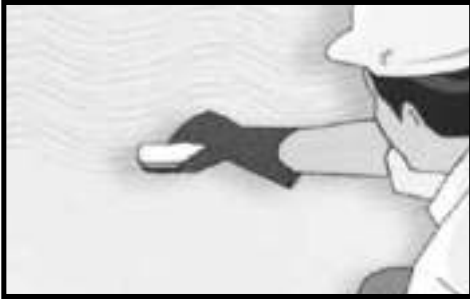

6. Pour water on the tile and use wooden trowel with Kbond Sanded Grout for grouting

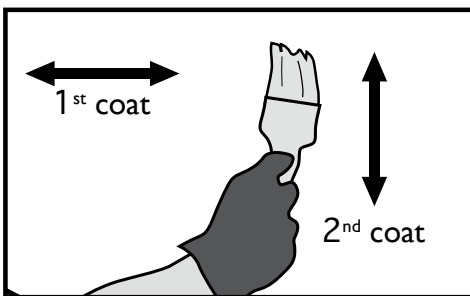

7. Use sponge with water to clean tile surface and leave 1 day

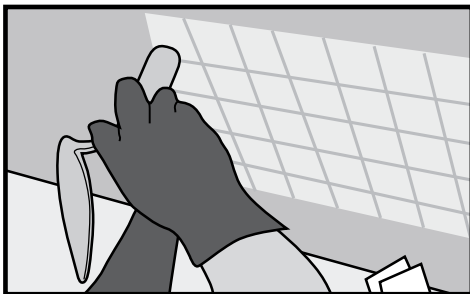

Methods of Kbond Tile adhesive and Grout usage (Swimming Pool)

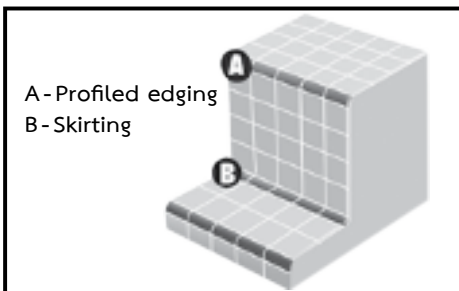

1. Adjust floor level before installation, use bonding agent after that use Kbond Red and slit to advance bonding and leave for 5-7 days

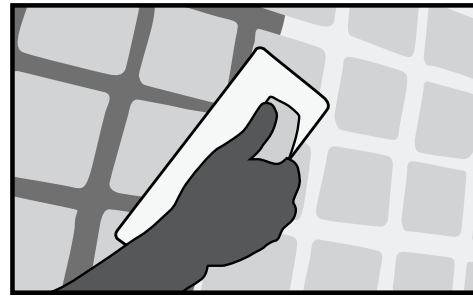

2. Use liner cement base (flexible type) 2 times 6 hour per round leave 3-5 days for liner settling and watering test 4 days and wait for dry 1-2 days

3. Draw the line and install with Kbond Red

4. For corner, use Coated Quart Round for beauty and safety of users

5. After installation, leave at least 1 day then grouting with Kbond Grout, After grouting cover with canvas 3 days to prevent shrinking

Kenzai Tile Cleaning Methods

2 Methods as follows :

Method 1 *Equipment*

1. Sprinkler

Cleaning method

1. Use sprinkler to clean the stain

Method 2 *Equipment*

1. Rubber Gloves
2. Hygiene or Detergent
3. Plastic Brush

Cleaning method

1. Spray and clean with hygiene or detergent brush with plastic brush
2. use water to clean hygiene

**can use brushing machine or nylon brush in the public for spontaneous and convenient cleaning*

Here some consideration about the characteristics of ceramic products depending from the production conditions.

One of the most important property that a tile, used for flooring, is the resistance to the aggression of:

- 1) LOAD (STAIC AND DYNAMIC)
- 2) ROLLING ACTION
- 3) IMPACT

All three of those “aggressive agents” can be contrasted mainly to a proper mechanical strength of the tile.

The International Standards EN14411 envisages two parameters for the evaluation of the mechanical strength:

1 BREAKING STRENGTH

His value corresponds to the effective load applied on a tile that lead to breakage, when the tile is sustained by two supports. The formula that correlates the load values to the size of the tile and the distance of the supports is:

$$S = F \frac{L}{b}$$

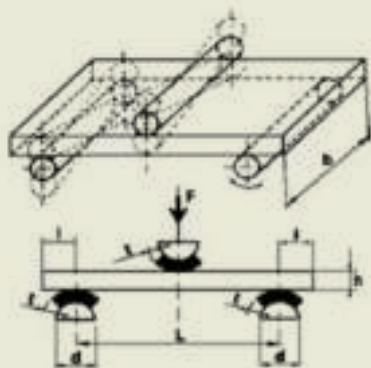

The measuring unit of S is Newton (9.8 Newton = 1 kg.)

2 BENDING STRENGTH (modulus of rupture).

His value provides the approximate mechanical strength of the ceramic tile independently of tile thickness; practically this value identifies the intrinsic value of the me chanical strength of the material. The formula giving the value of the modulus of rupture is:

$$\sigma = \frac{3FL}{2bh^2}$$

The measuring unit of σ is Newton/mm²

Where:

F = is the breaking load, or the force (express in Newton) necessary to apply that cause the test piece to break.

L = is the distance (expressed in mm) between the two supports that carry the tile piece

b = is the width (expressed in mm) of the tile test piece

h = is the minimum thickness of the tile test piece measured in the breaking's line.

The modulus of rupture is an intrinsic tile characteristic. It depends on the strength of the molecular bonds in the ceramic body, which in their turn are a function of the type of ceramic compounds which have developed during firing.

What is finally important in a tile used in a flooring, especially designed to use in difficult conditions (external public pavements or in very busy areas such as supermarkets)? Is the high Modulus of Rupture or the real high load that the tile can carry without breakage, once it is used in the flooring?

It is evident that the final customer will appreciate only the high load that the tile can support without breakage!

Suppose that the tiles are in the same conditions, with a bad installation, which has created only some points of support under their surface. We say that the tiles have an empty space and that the distance between the support points is 200mm. This is an example of very bad installation if it occurs in the reality, but it's just to give a clear idea of what we want to prove.

It is as well evident that it is in relation with

$$S:\sigma = \frac{3S}{2h^2}$$

One of the tiles (which we call A) has a modulus of rupture to 20N and a thickness of 9mm. The other tile (which we call B) has a higher modulus of rupture of 100% compared to A, that is to 40N and a thickness of 6mm, lower then to only 3 mm of 9mm, that is 33.3% less than A.

What do you expect would be the one that supports a greater load before breaking down?

TILE A

$$S:20 = \frac{3S}{2(9)^2}$$

$$S: 1080$$

TILE B

$$S:40 = \frac{3S}{2(6)^2}$$

$$S: 960$$

From the formulas above mentioned is easy to determine that the parameter that has the most effective role in the real load (*F*) that the tile can support without breakage is the thickness. In fact, to compensate just the 33% of reduced thickness, it is not enough to have a MOR 100% higher! The optimal choice selecting a floor tile, is to select product with good MOR, but paying very much attention to the rights thickness that will allows to face property to load that can occur on the floor where the tile will be utilized.

(Dr. Elio Gerardi , Ceramic Material Specialist ; Italy ,2017)

Durability of Ceramic Tiles

$$\sigma = \frac{3S}{2h^2}$$

σ = Bending Strength (Modulus of Rupture or MOR) (Newton/ mm^2)

S = Breaking Strength (Newton)

The measuring unit of S is Newton (9.8 Newton = 1 kg)

h = Is the minimum thickness of the line test piece measured in the breaking's line

Solution

Tile A MOR = 20 N/ mm^2
thickness 9 mm.

$$\text{Substitute : } 20 = \frac{3S}{2(9)^2}$$

$$S = 1,080 \text{ N.}$$

$$\text{Convert to KG : } \frac{1,080}{9.8} = 110 \text{ KGs.}$$

Tile B MOR = 40 N/ mm^2
thickness 6 mm.

$$\text{Substitute : } 40 = \frac{3S}{2(6)^2}$$

$$S = 960 \text{ N.}$$

$$\text{Convert to KG : } \frac{960}{9.8} = 97.95 \text{ kg}$$

The conclusion, tile A has a lower MOR test result, but it is able to gain more weight than tile B, even though tile B has a higher MOR test. From this formula Show that the thicker tile will affect the weight better:

Kenzai tiles MOR = 31 N / mm^2 thickness 13 mm.

$$\text{Substitute: } 31 = \frac{3S}{2(13)^2}$$

$$S = 3,492.66 \text{ N.}$$

$$\text{Convert to KG : } \frac{3,492.66}{9.8} = 356.39 \text{ KGs/mm}^2$$

The exterior decoration tiles have to be heavy duty tiles condition. The tiles should have high impact strength and should be capable to withstand wide range of toughness and heavy load. In case high pressure loading and high value of Breaking strength and Modulus of Rupture are very important to consider when the tile is used under heavy traffic condition.

Example

The result of using a low MOR tile or too thin tile.

Warning

1. Some manufacturers may provide false information on the test report; such as the object that is tested in the laboratory and the actual production's product is different properties' result. To assure the quality of the products that have been purchased, retesting the property of product in the certified laboratory is recommended. The actual result of the product that purchased in the project will be more precise. (Dr. Elio Gerardi , *Ceramic Material Specialist ; Italy ,2017*)

2. Water absorption should not be too low because it will affect to the floor and wall tiles installation. And it will absorb too little tile adhesive, which may be peeled off easily.

3. Some tiles that have low water absorption are from the waterproof coating on the front surface only. To find the actual water absorption of the tiles, it should be tested as removing the coated surface off, thus will result the actual percentage of water absorption.

THE ISSUE OF NATURAL TILES

Exposed aggregate finish wall

Has deep gap which absorbs dirt and stains easily including water and moisture. This causes mould and fungus. For this type the surface usually peels off easily.

Brick wall

Is made of low temperature fired brick, making it volatile and highly adsorbs water. This creates fungus and moss.

Sandstone

Is a natural stone that has many tiny holes absorbing high level water. This causes fungus and moss. Kenzai tiles have low water absorption which does not have the same problem as natural tile and have passed widely accepted standard both from U.S.A and Europe.

Plaster Wall

Will be easy to have stain, especially black spots, fungus. The problem of skin cracking when the time passes. Using Kenzai tiles will make the wall durable to stains, specially the wall will look better and more beautiful.

Cemented coated wall

Will have stains even only a little amount of time passes by and crack will also appear. Using Kenzai tile makes the wall more durable, stainless and more attractive.

Painted wall

Will have stains in a short period of time, the color will fade resulting in more investment in renovation. Unlike using Kenzai tile for outdoor decorations, which have been fired at high temperature resulting in higher usage life.

Material

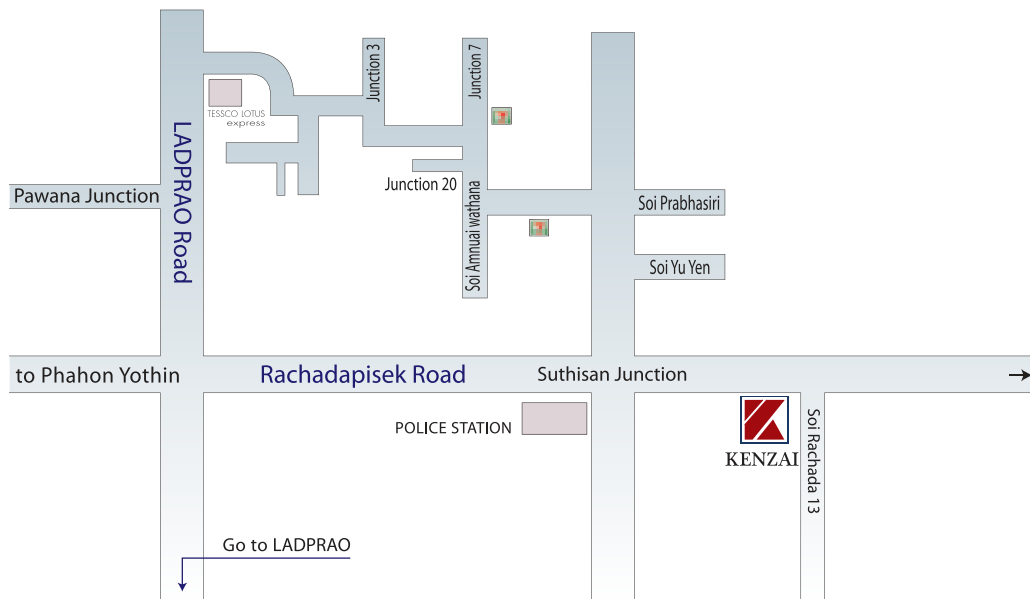

Used for wall must pass the accepted standard quality test because if the materials fail the test, problems are likely to arise such as stains, cracks, volatilities etc. causing more maintenance cost in the future.

Wall tiles adhesion

In some materials is low adhesion especially outdoors that must consider about exposed from sunlight and rain for a long time.
